# Agenda

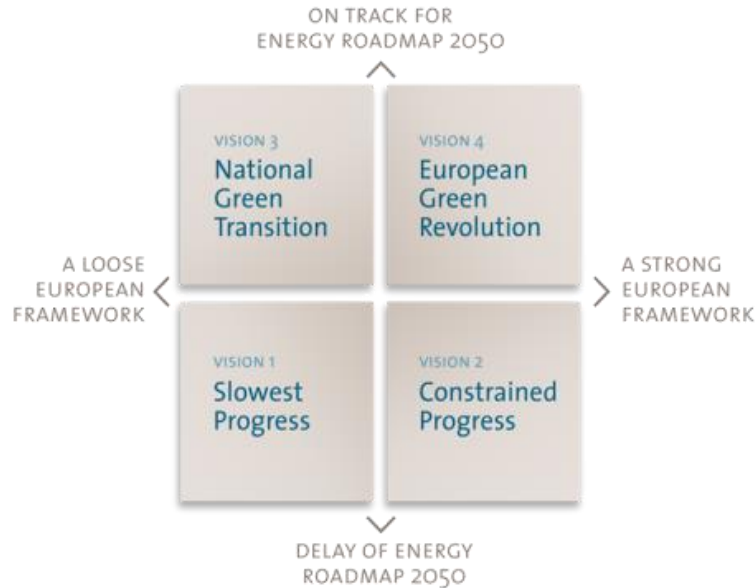

1. Framework conditions
  - scenarios for analysis of City solutions
2. Analysed Power-Heat-Gas-Fuel solutions (City)
3. Market solutions to control the system integration
4. The need for data in the heating system
5. Questions

## Uncertainties in international framework conditions (fuel and CO<sub>2</sub>-prices, focus on green energy etc.)

- *A need for scenarios to handle uncertainties*

# Scenarios – to cope with an uncertain future

Danish scenarios based on ENTSO-E European scenarios

## Scenario 3 – Green Nations

- Danmark showcase for transition towards “Well below 2 degr.” target
- Low international cooperation but many countries are ambitious
- IEA 450 PPM price level (low fuel and high CO2 prices)

### National focus

- Denmark low RE-ambition
  - only what's internationally imposed
- Low international cooperation – “Brexit” tendencies in Europe – no EU carbon market
- Few reforms of tax/regulation in DK and EU
- IEA Current Policies fuel prices
  - High fuel-prices and low CO2-prices

## Scenario 1 – Moderate Nations

High focus RE

Low focus RE

## Scenario 4 – Green Europe

- EU showcase for Green transition (COP21) – Energy Union
- International cooperation in EU – Energy Union with markets for Green gas
- IEA 450 PPM price level (low fuel and high CO2-prices)

EU Energy Union

- Moderate ambition RE in EU and DK
- High international cooperation – EU regulation, standards and grid codes
- IEA New Policies price level
  - Medium Fuel and CO2-prices

## Scenario 2 – Moderate Europe

# Scenarios – power, heat and fuel production in scenarios

## Scenario 3 – Green Nations

- Traditional CHP units
- **Power/heat integrated biorefineries**
- Large heat pumps
- Individual heat pumps

High focus RE

## Scenario 4 – Green Europe

- Traditional CHP units
- **Power/heat integrated biorefineries**
- Large heat pumps
- Individual heat pumps

National focus

- Traditional CHP units (coal, n-Gas, biomass)
- Boilers for heat production (biomass, gas)

EU Energy Union

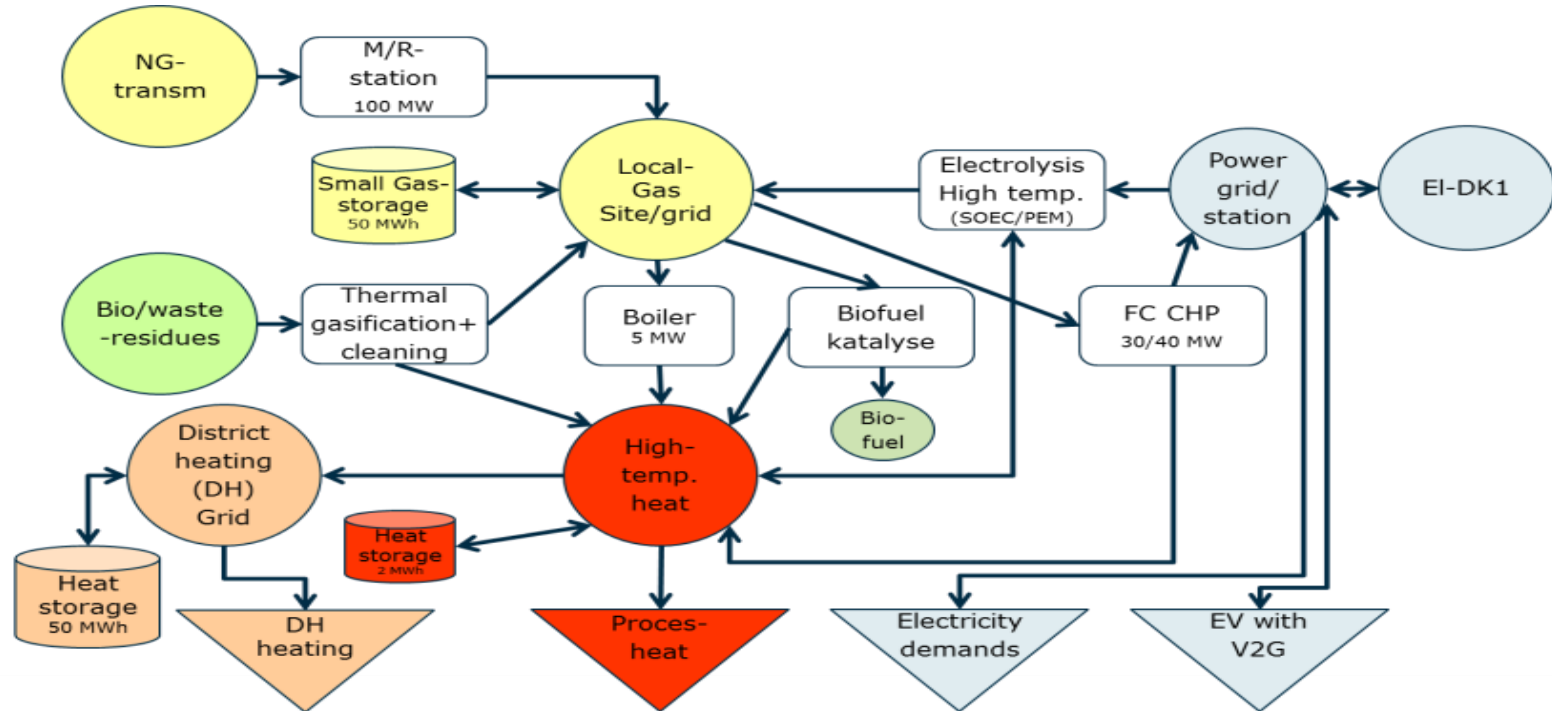

- Traditional CHP units (Gas, Biomass)
- Boilers for heat production (biomass, gas)
- A few large heat pumps (district heat)
- Electric boilers

Low focus RE

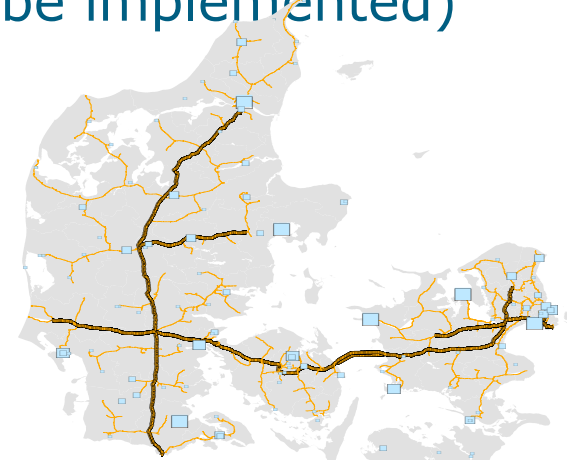

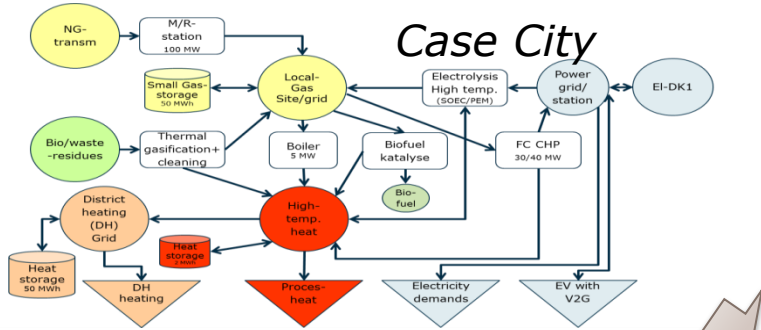

## Scenario 1 – Moderate Nations

## Scenario 2 – Moderate Europe

# Example on power/heat bio refinery (case 2035)

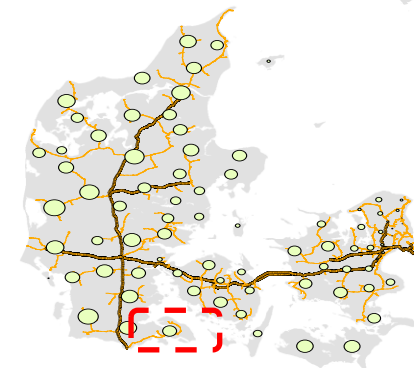

# From case "Cities" to national solutions (to be implemented)

Gas grid and existing Power plant capacity

Heat demands

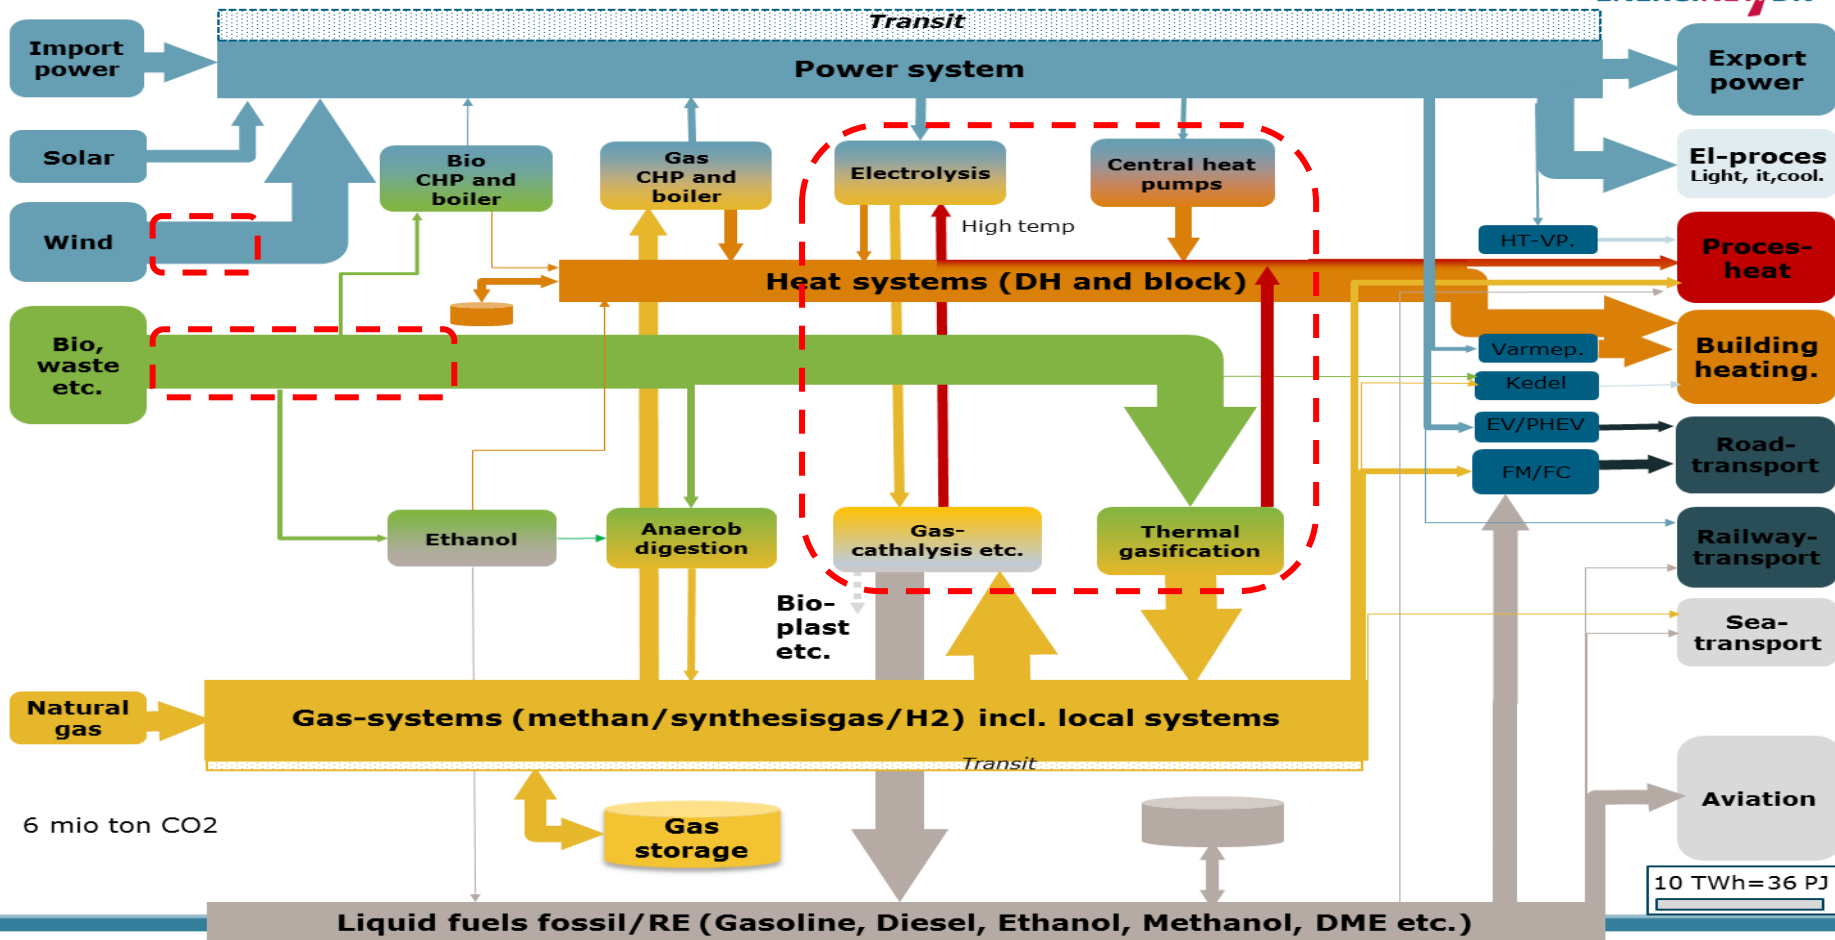

Biogas resources

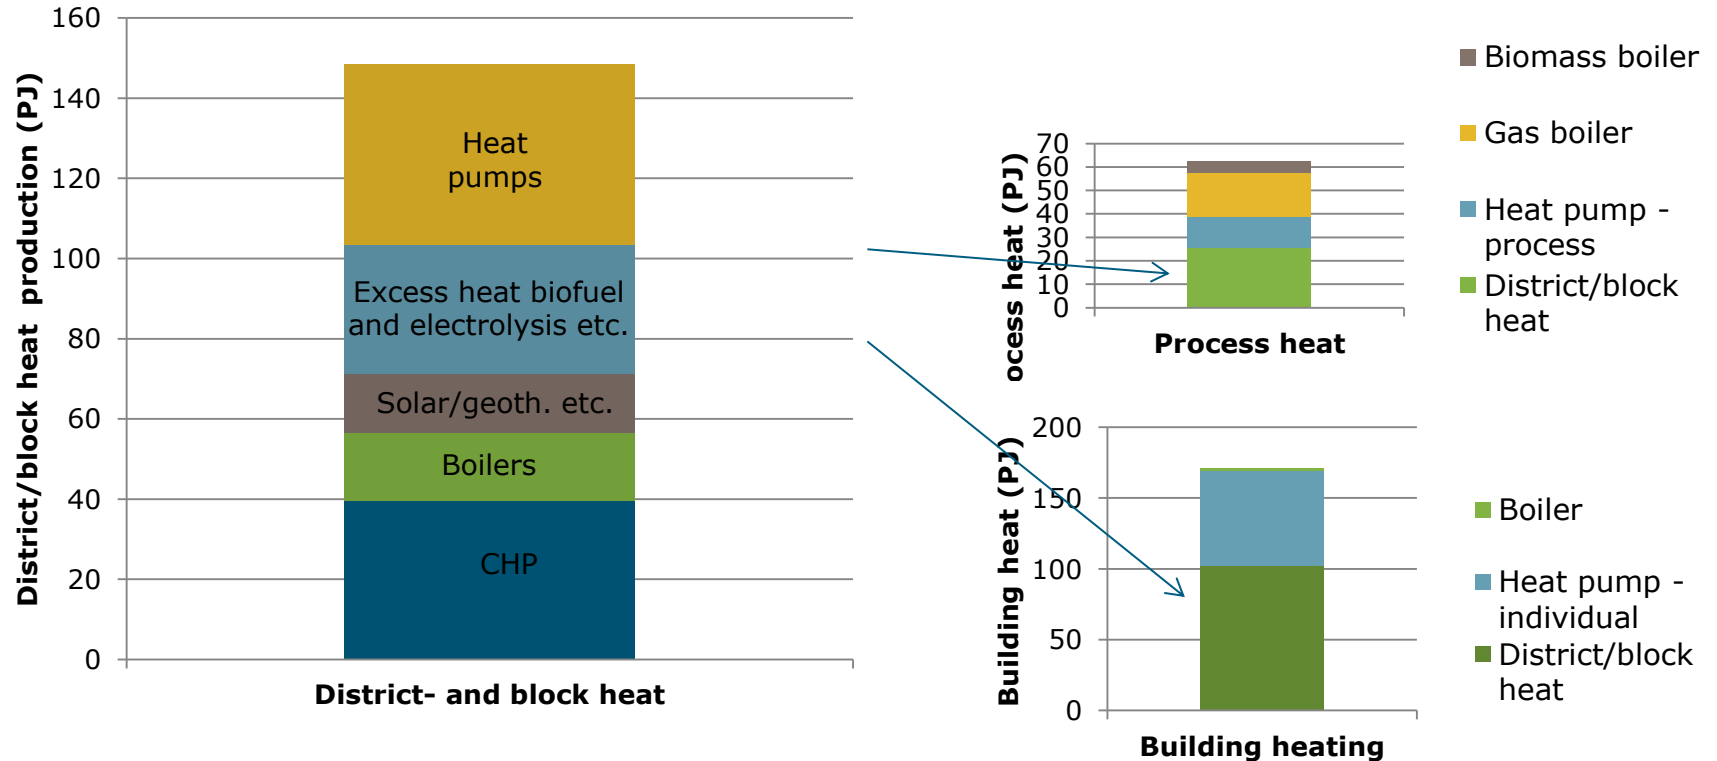

# Post 2030 - feasibility study 2035 - reduced fossil oil demand

# Feasibility study 2035+ – reduced fossil oil demand

# Production and consumption of heat – case study 2035+

# Examples of heat and power prices in a 2035 case simulation ! (large plant with integrated power/heat/Fuel production)

## Heat prices in an area with large plant with integrated power/fuel/heat production

Individual climate units to produce heat in hours with low electricity prices ?

## Some questions

- Use of local climate units (heat pumps/cooling) integrated with DH
- Delivery from commercial buildings with cooling units
- Delivery of heat to DH ?
  - Need for data
  - Marginal price/value at delivery point
  - Temperature levels for delivery at DH point and value of delivery
- Market solutions to integrate power and heat
- Use of big data technology on DH data collection to identify
- How to combine "2016" metered data with Scenario 2030 data ?

# Examples of heat and power prices in a 2035 case simulation ! (large plant with integrated power/heat/Fuel production)

## Heat prices in an area with large plant with integrated power/fuel/heat production

A need for a market solutions in heat and power to handle fluctuating prices

# Analysis of Energy System dynamics

- including power TSO/DSO (and potentially heat market)

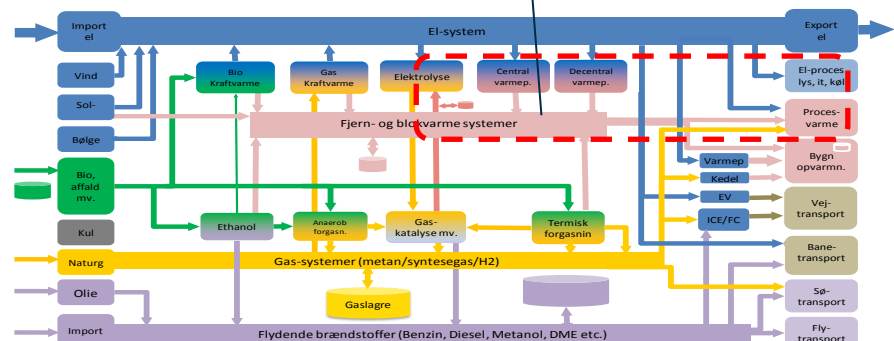

Reg.

- Energy conversion units
- Electric vehicles
  - Heat pumps/Climate units
  - Other flexible units

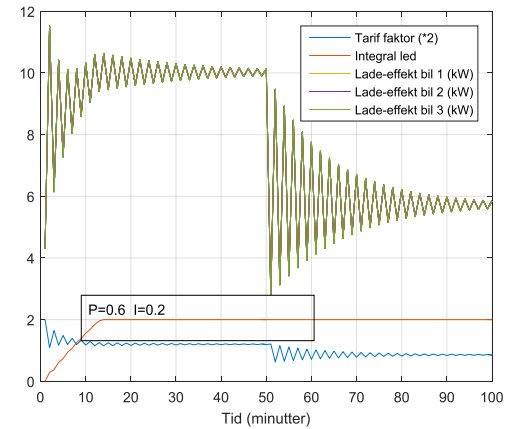

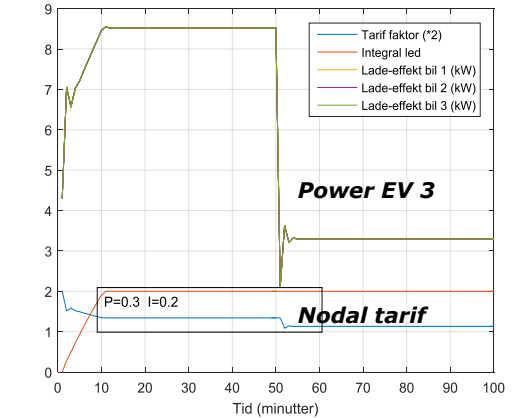

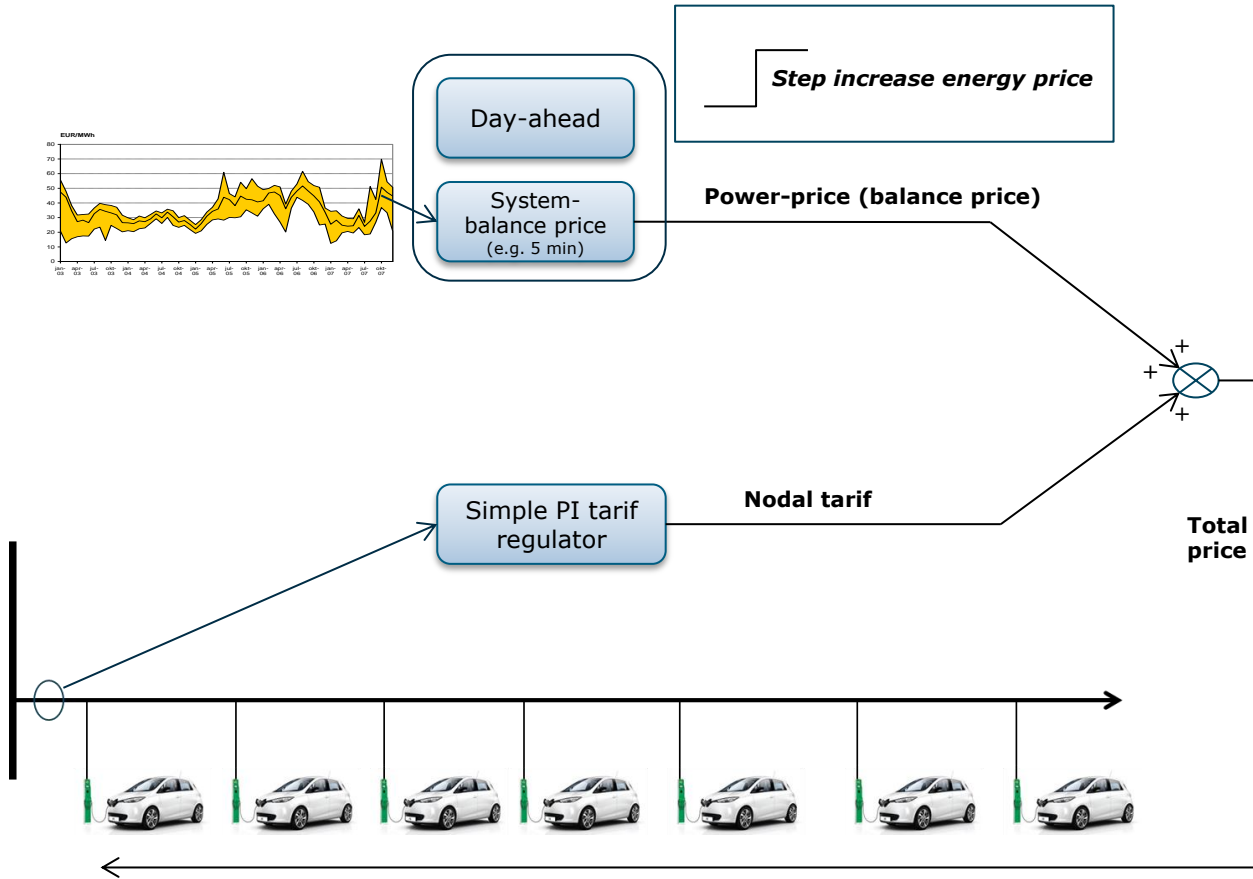

DSO D-LMP

Reg.

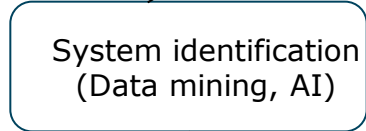

# Analysis of Energy System dynamics – step response

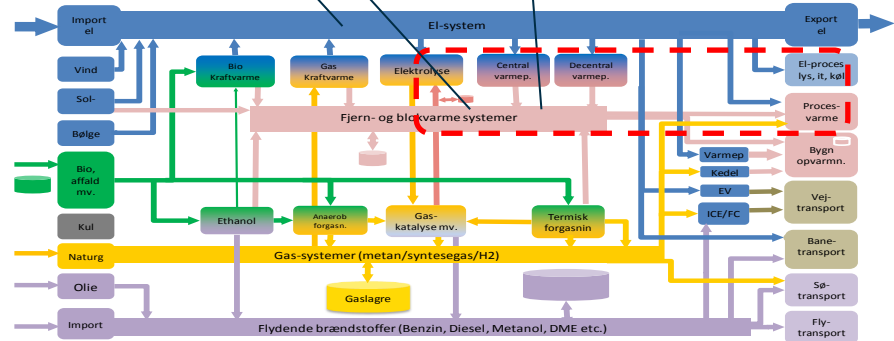

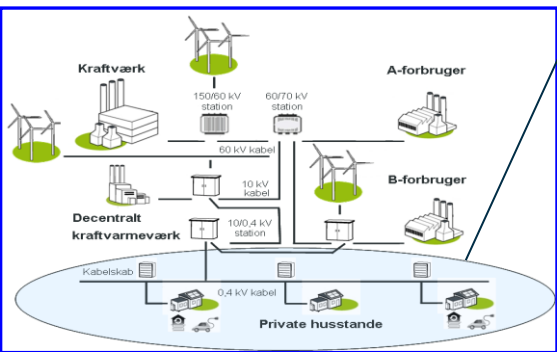

# Analysis of Energy System dynamics

- including power TSO/DSO (and potentially heat market)

- Energy conversion units
- Electric vehicles
  - Heat pumps/Climate units
  - Other flexible units

## Summing up

- In the high RE scenarios (3,4) there is a number of energy conversion processes (bio-to-fuel, power-to-gas, CHP) producing waste heat
- Production price (marginal) for power, heat and gas-price are fluctuating
- There is a need for an intelligent heating system with dynamic pricing for heat (high/low temperature)
- Big data methodology, data-mining and AI could lead to deeper knowledge on system response related to state-parameters in the heating system
- The knowledge from system-identification could be used to controlling/market solutions in power and heat systems (E-MPC etc.)
