Exploiting Flexibility in Coupled Electricity and Natural Gas Markets: A Price-Based Approach

Christos Ordoudis

Supervisors: Pierre Pinson, Juan M. Morales and Jalal Kazempour

Introduction

• Renewable energy sources make up a high share of electricity production.

Electricity and Natural Gas Markets

Decoupled Market

Partial price coordination: GFPPs price-quantity offers based on estimated natural gas price.

Results

Three thermal units -- Two GFPPs -- Two NG producers 2 3 Unit *i* 4 5 Unit *k*

GFPPs are an ideal choice to facilitate the transition to a green energy system.

- Tighter coupling of electricity and natural gas markets can promote the integration of renewables in the energy system.
- Coupling these two markets is a natural way to increase the coordination between the two systems that have existing synergies mainly through the GFPPs.
- Manage high uncertainty on both supply and demand sides.

Aim

- Design market-based coordination mechanisms and decision support tools to harness flexibility and promote integration of renewables.
- Preserve existing sequential market structure.
- Optimal tuning of market parameters to enhance temporal coordination.

Coupled Market

Perfect price coordination: GFPPs price offers based on true value of natural gas.

Optimization Models

Sequential coupled electricity and natural gas model

-	P_i^{\max}	80	110	50	100	100	G_{k}^{\max}	150	100
	\dot{P}_i^+	10	0	30	25	20	\hat{G}_{k}^{+}	50	20
	P_i^{-}	10	0	30	25	20	G_k^{-}	50	20
	Ċi	30	10	-	-	60	$\hat{C_k}$	120	160
	$\phi_{i_{m{g}}}$	-	-	0.2	0.3	-			

Table 1: Electricity and natural gas system data.

Figure 1: Impact of wind power penetration level on the expected system cost.

Wind power penetration level (%)	25	30	35	40	45	50
Exp. savings (\$)	971.5	4 663	8035.6	12 251.8	14562.4	19601.6
Exp. payment/charge (\$)	-352.1	-177.1	-21.4	133.5	2.2	302.3

Table 2: Expected payment/charge to generate flexibility price signal.

Real-time surplus/deficit can be addressed through proper regulation, e.g., flexible capacity remuneration mechanisms.

80 –

• Implicit coordination via proper flexibility price signals.

Market Clearing Approaches

Stochastic coupled electricity and natural gas model $\therefore \mathcal{O}D + \mathcal{O}D + \mathbb{E}\left[\mathcal{O}B(z) + \mathcal{O}B(z)\right]$

min
$$\mathcal{C}_{e}^{D} + \mathcal{C}_{g}^{D} + \mathbb{E}_{s}[\mathcal{C}_{e}^{D}(s) + \mathcal{C}_{g}^{D}(s)]$$

s.t. $\mathcal{Q}_{e}^{D}; \mathcal{Q}_{g}^{D}$
 $\mathcal{Q}_{e}^{B}(s), \mathcal{Q}_{g}^{B}(s), \forall s \in \mathcal{S}$

The stochastic coupled market model establishes an ideal benchmark in terms of minimum expected system cost.

Implicit coordination mechanisms

- Reveal adequate flexibility to cope with real-time imbalances.
- Respect merit-order principle of sequential market.
- Ensure cost-neutrality at the day-ahead stage. Flexibility price signals

Price-based coupled electricity and natural gas model

Figure 2: Hourly natural gas price adjustment (black line: left y-axis) and dayahead financial settlement of the system operator to adjust the natural gas price (colored areas: right y-axis). Wind power penetration 50%.

Figure 3: Hourly natural gas price adjustment (black line: left y-axis) and difference in NGFPPs' share of total power production between P-B and Seq (colored areas: right y-axis). Wind power penetration 50%.

Stochastic market clearing

Co-optimization of two trading floors:

- 1) Day-ahead dispatch is determined by co-optimizing day-ahead and real-time dispatch, where wind power uncertainty is probabilistically described.
- 2) A balancing market is cleared for real-time operation.
- 3) Perfect temporal coordination.

GFPPs: Gas-fired power plants NG: Natural gas LMP: Locational marginal price

	$\min \mathcal{C}_e^D + \mathcal{C}_g^D + \mathbb{E}_s[\mathcal{C}_e^B(s) + \mathcal{C}_g^B(s)]$					
Upper-level	s.t. $\underline{\chi} \leq \chi^P \leq \overline{\chi}$					
System/market operator	DA cost-neutrality					
Lower-level Sequential market χ^{λ} clearing	$\mathcal{L}_{e} \left(\begin{array}{c c} \chi^{\prime} & \mathcal{C}_{e}^{D} \mathcal{C}_{g}^{D} \\ \hline \min \ \mathcal{C}_{e}^{D} \\ \text{s.t.} \ \mathcal{Q}_{e}^{D} \end{array} \right) \xrightarrow{\xi_{e}^{D}} \left(\begin{array}{c} \min \ \mathcal{C}_{g}^{D} \\ \text{s.t.} \ \mathcal{Q}_{g}^{D} \end{array} \right) \xrightarrow{\xi_{e}^{D}} \left(\begin{array}{c} \min \ \mathcal{C}_{g}^{D} \\ \text{s.t.} \ \mathcal{Q}_{g}^{D} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{B}} \left(\begin{array}{c} \mathcal{C}_{g}^{B} \\ \mathcal{C}_{e}^{B} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{B}} \left(\begin{array}{c} \mathcal{C}_{g}^{B} \\ \mathcal{C}_{e}^{B} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{B}} \left(\begin{array}{c} \mathcal{C}_{g}^{D} \\ \mathcal{C}_{e}^{D} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{B}} \left(\begin{array}{c} \mathcal{C}_{g}^{D} \\ \mathcal{C}_{e}^{D} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{B}} \left(\begin{array}{c} \mathcal{C}_{e}^{D} \\ \mathcal{C}_{e}^{D} \end{array} \right) \xrightarrow{\mathcal{C}_{e}^{D}} \left(\begin{array}{c} \mathcal{C}_{e}^{D$					
	ξ_e^D ξ_g^B					
	$\min \mathcal{C}_e^B(s) \mid_{\xi_e^B} \min \mathcal{C}_g^B(s)$					
χ^{P} NG price adjustment	s.t. $\mathcal{Q}_e^B(s)$ s.t. $\mathcal{Q}_g^B(s)$					
	$\forall s \in \mathcal{S} \qquad \forall s \in \mathcal{S}$					

Conclusions

- The proposed mechanism enables an **implicit** temporal coupling of the day-ahead and balancing markets, while preserving the existing sequential market clearing of those trading floors.
- The adjustment of natural gas price affects the dispatch of units and reveals available flexibility to handle wind power uncertainty.
- Cost-neutrality at the day-ahead stage is **ensured**, while the natural gas price adjustment only affects the payment/charge at the balancing stage.
